Math 430 / Math 505 Introduction to Complex Geometry – Final

1	2	3	4	5	TOTAL
30	30	30	10	0	100

Please do not write anything inside the above boxes!

Check that there are **4** questions on your booklet. Write your name on top of every page. Show your work in reasonable detail. A correct answer without proper or too much reasoning may not get any credit.
Submit your solutions on this booklet only. Use extra pages if necessary.

Rules for Homework and Take-Home Exams

(1) You may discuss the problems with your classmates or with me, or even with people who took this course before. It is not considered good behavior to ask these questions at online forums without mentioning that these are homework questions of an introductory course.

(2) You may use any written source be it printed or online. Google search is perfectly acceptable.

(3) **It is absolutely mandatory that you write your answers alone.**

(4) You must obey the usual rues of attribution: all sources you use must be explicitly cited in such a manner that the source is easily retrieved with your citation. This includes any ideas you borrowed from your friends. *(It is always nice to flatter your friends by using their ideas and thanking them.)*

(5) Even if you find a solution online, you must rewrite it in your own narration, fill in the blanks if any, making sure that you exhibit your total understanding of the ideas involved.

(6) Do not lend your written work to your friends and do not ask to borrow their written work. You may explain your solutions to your friends to any degree of detail you like, or you may ask them as many questions as they are willing to answer. **But the final writing process should be done alone.**

Affidavit of compliance with the above rules: I affirm that I have complied with the above rules in preparing this submitted work. Moreover I declare that every solution I wrote reflects my true understanding of the problem, and any sources used, including ideas from friends, are explicitly cited without exception.

Please sign here: *Date:*

Q-1) Let s and s' be two holomorphic sections of a line bundle L on the complex manifold M. Show that s/s' is a meromorphic function on M.

Solution:

NAME: STUDENT NO:

Q-2) Show that the hyperplane bundle $[H]$ on $\mathbb{P}^n$ always has a holomorphic section which vanishes exactly on the hyperplane H.

Solution:

NAME: STUDENT NO:

Q-3) Prove that every line bundle on a compact complex Riemann surface X is the line bundle associated to some divisor.

You can use the following data: For a line bundle L define

$$h^q(L) = \dim_{\mathbb{C}} H^q(X, \mathcal{O}(L)),\ q = 0, 1.$$

The problem is to show that $h^0(L) \neq 0$ for all line bundles L.

The Chern class $c_1(L)$ of a line bundle is an integer also denoted by $\deg(L)$. For two line bundles L_1 and L_2 we have $\deg(L_1 + L_2) = \deg(L_1) + \deg(L_2)$. Also $\deg(-L) = -\deg(L)$. If $D = \sum n_p \cdot p$ is a divisor, then we define $\deg(D) = \sum n_p$. Then $\deg([D]) = \deg(D)$. If $\deg(L) < 0$ then $h^0(L) = 0$. If we denote the canonical divisor of X by K, then $h^1(L) = h^0(K - L)$. Define a function on line bundles as

$$\phi(L) := h^0(L) - h^1(L) - \deg(L),$$

where L is a line bundle. It is known that this function is constant. It is also known that $\phi(L + [D]) = \phi(L)$ for any divisor D.

First fix an arbitrary line bundle L and show that if $h^0(L + [D]) \neq 0$ for some divisor D, then $h^0(L) \neq 0$. So assume that $h^0(L + [D]) = 0$ for all divisors D and obtain a contradiction.

Hint: Use $\phi(L) = \phi(L + [D])$ and show that the right hand side actually depends on D when $\deg(D)$ is very large.

Solution:
