Q-1) Let $f(x) = \dfrac{1}{1+x^2}$.

(i) Write an equation for the tangent line to $y = f(x)$ at $x = t$

(ii) Let $A(t)$ denote the area of the triangle formed by the coordinate axes and the above tangent line. Find $A(1)$.

Answer: If $f(x) = \dfrac{1}{1+x^2}$, then $f'(x) = \dfrac{-2x}{(1+x^2)^2}$, and at the point $x = t$, the slope of the tangent line is $f'(t) = \dfrac{-2t}{(1+t^2)^2}$. Then an eqution for the tangent line at the point $(t, \dfrac{1}{(1+t^2)})$ is

$$y = \frac{-2t}{(1+t^2)^2}(x-t) + \frac{1}{(1+t^2)}.$$

When $x = 0$, we find that the y-intercept is y_0, and when $y = 0$, we find that the x-intercept is x_0, where

$$x_0 = \frac{1+3t^2}{2t}, \quad y_0 = \frac{1+3t^2}{(1+t^2)^2}.$$

Thus the area of the above mentioned triangle is

$$A(t) = \frac{1}{2}\, x_0\, y_0 = \frac{(1+3t^2)^2}{4t(1+t^2)^2}.$$

Finally, we evaluate this at $t = 1$, to find

$$A(1) = 1.$$
