Q-1) Let $f(x) = \frac{4x^2 + x - 2}{x + 1}$.

(i) Calculate, and simplify $f'(x)$.

(ii) Calculate, and simplify $f''(x)$.

(iii) Plot the graph of $y = f(x)$ indicating all significant data on the graph, such as roots, local min/max, concavity, inflection points, asymptotes.

Answer:

$f(x) = \frac{4x^2 + x - 2}{x + 1} = (4x - 3) + \frac{1}{x + 1} = 0$ when $x = -\frac{1}{8} \pm \frac{\sqrt{33}}{8}$. Clearly one root is slightly less than zero and the other is slightly larger than zero. (0.59 and -0.84)

$$f'(x) = 4 - \frac{1}{(x + 1)^2} = \frac{4x^2 + 8x + 3}{(x + 1)^2} = 0 \text{ when } x = -\frac{1}{2} \text{ or } x = -\frac{3}{2}.$$

$$f''(x) = \frac{2}{(x + 1)^3}.$$

Note that we have a vertical asymptote $x = -1$ and a slant asymptote $y = 4x - 3$.

Here is the graph:
